The period of a pendulum is $T = 2\pi\sqrt{\frac{l}{g}}$ for small angles $\theta \ll \frac{\pi}{2}$, and the energy $E = mc^2$ does not depend on x_i or y^{n+1}.

The roots of a quadratic are

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

and a sum and an integral read

$$\sum_{i=1}^{n} i^2 = \frac{n(n+1)(2n+1)}{6}$$

$$\int_0^1 x^2 dx = \frac{1}{3}$$

Inline, the same sum is $\sum_{i=1}^{n} i$ and a function $\sin(x+y)$ with $\left(\frac{a}{b}\right)$ in brackets. A long inline expression breaks after an operator: $f(x) = a_0 + a_1 x + a_2 x^2 + \cdots + a_n x^n$ and the text continues after it.

A rotation matrix and a nested fraction:

$$R = \begin{bmatrix} \cos\theta & -\sin\theta \\ \sin\theta & \cos\theta \end{bmatrix}, \qquad \frac{\frac{a}{b}}{c}$$
